These interactive Java applications should work on any computer with Java installed. Execution of applications is on the desktop in a window opened by Java. The applications have been recently redesigned to be auto-scaling by sensing the resolution of the screen, to be well readable also on most high resolution monitors. This is the newest version which has not been ported yet to the website of the book for which they have been written, but testing has been done on a number of monitor configurations on Windows and Apple Mac computers, and they work properly on all the many computers I own. Full HD (1920 x 1080) is recommended but it should not be necessary. Some of the applications in this series have had occasional problems with Microsoft Surface computers, because of non-standard video defaults, which have not been fully investigated but a change of resolution seems to correct the issue for now. If you encounter any issue with your computer set up or discover any bug, please let me know.
